Visualization as Gamechanger in Historiography

Visualization is one of the most consequential game changers in all contemporary sciences. It changes how we encode knowledge in a medium and how we decode it in the process of reception. By doing so the structure of knowledge itself is changed. This is particularly evident in two areas: heuristics, in which hypotheses are derived from a first sketch of the empirical material, and narration, in which knowledge is passed on. The lecture deals with the basic structures of this fundamental change.

Stefan Haas completed his dissertation and habilitation at the University of Muenster. After a few years at the University of Toronto in Canada he became Professor of Theory and Methodology of History at the University of Goettingen.
