2016

- Konus-Wind is a joint Russian-US experiment for gamma-ray burst and solar flare studies.
- Launched on November 1, 1994.
- Two detectors S1 and S2
NaI(Tl) 13 cm × 7.5 cm, Be entrance window are located on opposite faces of the Wind spacecraft, observing correspondingly the southern and the northern ecliptical hemispheres.
- Continuous observations of all sky.
- ~ 20 keV–15 MeV energy range (present time).
- Since July of 2004 is orbiting around L1 at ~5 light seconds from Earth.
- Doesn't suffer from "nights".
- Exceptionally stable background.

- Konus-Wind operating modes
 - Waiting mode:
Count rate in 3 energy channels:
G1 ($\sim 20\text{--}80$ keV),
G2 ($\sim 80\text{--}300$ keV),
G3 ($\sim 300\text{--}1200$ keV) with
accumulation time 2.944 s.
 - Triggered mode:
Count rate in the same 3
channels with variable time
resolution from 2 to 256 ms, the
total duration ~ 240 s.
64 multichannel spectra in two
partially overlapping energy
ranges ~ 20 keV–15 MeV.
Accumulation times:
64 ms–8.192 s
- After accumulation of energy
spectra the instrument is inactive
for ~ 1 hour, only count rate curve
in G2 channel is available with
accumulation time 2.944 s.

- Summary (up to June, 2016), only
triggered events:
 - 2700 Gamma-Ray Bursts
 - 253 Soft Gamma Repeater
Bursts
 - 1021 Solar Flares.

- Konus-Wind energy resolution - FWHM/E.
- Fermi-GBM spectrum for solar flare 12-Jun-2010 ~ 0.55 UT from Ackermann et al., 2012 (bottom left).
- Konus-Wind spectrum for the same flare (bottom right), only second energy range was fitted, first range suffers from pile-up distortions.

Figure : Annual solar flare trigger statistics over the experiment duration

Criteria for event to fall in solar database

- The flare presents in the GOES event list
<ftp://ftp.swpc.noaa.gov/pub/warehouse>.
- $T_{begin}(\text{GOES}) < T_{trigger}(\text{KW}) < T_{max}(\text{GOES})$.

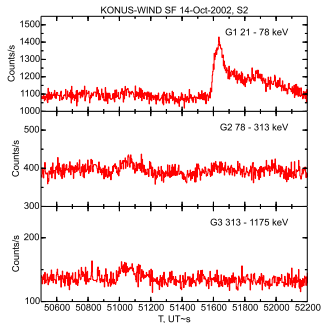

Solar Flare Examples: Flare with delayed heating 10-Mar-2002 01:35 UT

- A flare with delayed heating 10-Mar-2002 01:35 UT (GOES class C5.1) from Fleishman et al., 2016.
- Occured during RHESSI "night".
- Top to bottom: Soft X-ray (GOES), microwave (NoRP) and Hard X-ray (Konus-Wind) light curves.
- Very hard for a typical C-class flare (HXR spectral indices ~ 2.5).
- Delay of thermal SXR emission is due to interaction between small and big flaring loops.

Solar Flare Examples: Behind-the-limb Solar Flares

- Originate in the high corona.
- Show Frost-Dennis signature (originating from second stage acceleration) which is not contaminated by "ordinary" X-ray emission:
 - No Soft X-ray event
 - Smooth hard X-ray time profile
 - Flat hard X-ray spectrum.
- Flare 1-Sep-2014 ~11:00 UT: long duration flare observed by Konus-Wind in waiting mode.
- Flare 14-Oct-2002 ~14:20 UT: observed by Konus-Wind in waiting mode.

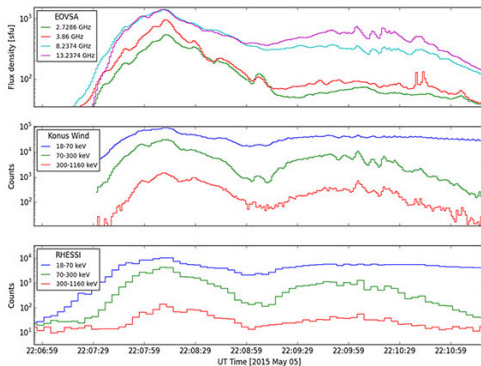

- The flare was detected by KW for the entire duration (1.5 hours) in the waiting mode (Kashapova et al, talk RHESSI 2015).
- Photon spectral index was found using 3-channel fitting.
- The first phase of electron acceleration followed by the decrease of the magnetic free energy.
- The harder peak onset was preceded by significant rise of the magnetic free energy.
- The energy decrease didn't occur during the hardest phase of the flare. It happened later during the phase of post-eruptive source formation.

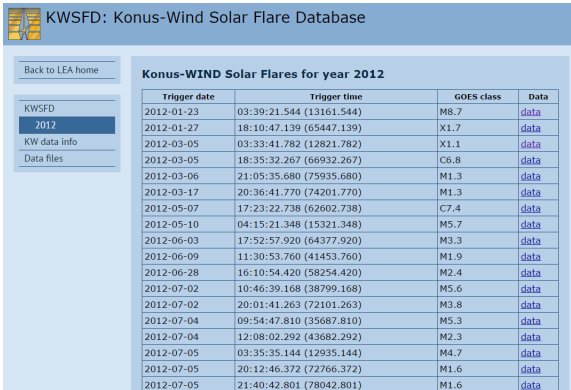

Solar Flare Examples: X2.7 class Flare of 5-May-2015

- The flare was detected in the triggered mode. (see RHESSI nugget by D. E. Gary and G. Fleishman).
- During the decay phase the microwave emission (from EOVSAs) shows series of pulsations, also observed by Konus-Wind.
- There are 2 peaks seen in the 3.86 GHz curve (red) and Konus-Wind 300-1160 keV light curve about 22:10:40.
- Konus sees gamma rays with good SNR to energies well above 7 MeV.

- KWSFD can be accessed from the Ioffe website (<http://www.ioffe.ru/LEA/KWSFD>).
- It contains flares registered in triggered mode.
- At present, only flares for year 2012 are available. The remaining events will be added within few months.

- KWSFD provides spectral data in FITS format as well as light curves in IDL SAV and ASCII formats.
- **To be done:** utility for extracting PHA for individual spectra (PHA-I) from PHA with multiple spectra (PHA-II).

KWSFD: Konus-Wind Solar Flare Database

The flare on 13 November 2012, 05:47:14 (20834)

Konus-Wind X-ray light curves:

- [ASCII](#) (3 channel light curve in ASCII format)
- [IDL SAV](#) (3 channel light curve in IDL SAV format)

Konus-Wind spectral data:

- [PHA-1](#) (low-energy spectral data)
- [PHA-2](#) (high-energy spectral data)
- [RME-1](#) (low-energy response matrix)
- [RME-2](#) (high-energy response matrix)
- [ABE](#) (angular response matrix)

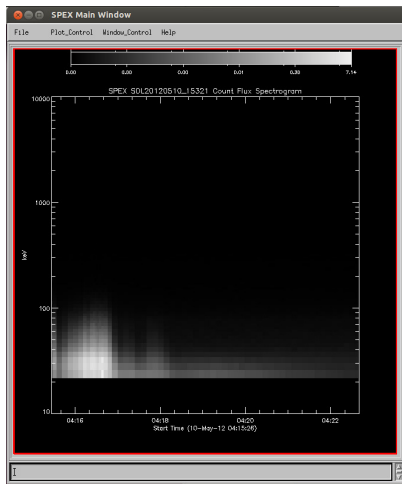

[Data format description](#)

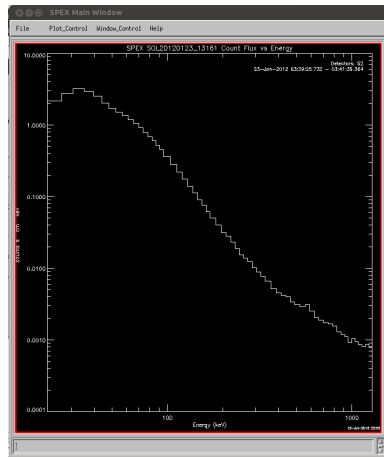

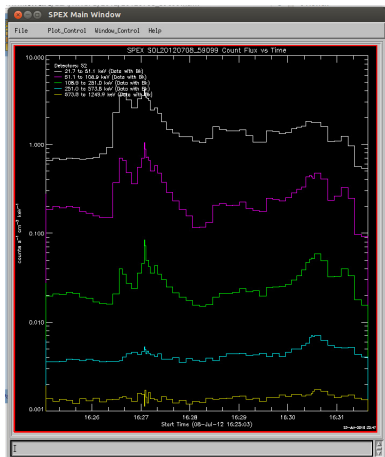

Page last updated: 2012-11-13

Information available from the light curve file:

- Energy channel bounds.
- Statistics on background approximation.
- Begin and end of the time bin.
- Counts/s in G1, G2, G3 (dead-time corrected).
- Background in G1, G2, G3.
- Background subtracted counts in G1, G2, G3.
- Background subtracted count errors (1 sigma hereafter).
- Hardness ratio $G2/G1$ and its error.
- Hardness ratio $G3/G2$ and its error.

- The IDL routine for reading and processing KW FITS spectral files has been added to the OSPEX package and now available from SSW.

Thank you for your attention!

- NaI(Tl) crystal 13 cm × 7.5 cm, Be entrance window, Al container 1.75 mm thick (left).
- Incident angle for Solar flare emission $\theta=90^{\circ}$.
- Effective area for $\theta=90^{\circ}$ obtained from Geant4 modelling (right).

- Energy channel calibrations are held using 1460 keV line emitted by ^{40}K from the lead-glass PMT window.
- Energy bounds changed during Konus-Wind operating history within a factor of 2 for S1 and a factor of 1.5 for S2.

- Sakamoto et al. 2011a: cross-calibrations for Konus-Wind, Suzaku/WAM and Swift/BAT for GRBs spectral parameters.
- Light curves comparison between Konus-Wind and RHESSI for submillimeter solar flare SOL2003-11-02T17:17 (see also Silva et al., 2007, Krucker et al., 2013).
- **To be done:** spectral cross-calibrations for solar flares.

- **Caveat:** For long-duration flares 64 energy spectra do not cover neither event continuation, nor background spectra. Example: : flare 26-Oct-2003 (see also I. Zimovets, A. Struminsky, 2012). **To be done:** Add background spectra from neighbouring trigger event with close background levels.
